

CSS Paged Media fixture

Section one

Page boxes, margins, and type are declared in CSS. This paragraph is intentionally short so the heading and body remain a unit.

Section two

The second section tests break-inside avoidance and widow/orphan controls. The browser is responsible for resolving the fragmentation when the page fills.

Forced page

This heading begins after an explicit page break.

Overflow probe

This element is taller than one page. The W3C page specification leaves content outside the page box to user-agent handling. This fixture records what the browser actually emits.
